

Electrolyte solution

Presented by the Pharmacist Muhanad S. Al-Ani PHAR 201 1st semester Week number 1 19/11/2023

Outline

- 1. Van't Hoff factor (i)
- 2. Ion pairing
- 3. Colligative Properties of Electrolyte Solutions
- 4. Degree of dissociation
- 5. Ionic strength
- 6. The L value

Objectives

- 1. Understand the important properties of solutions of electrolytes.
- 2. Compare and contrast the colligative properties of electrolytic solutions and concentrated solutions of nonelectrolytes.
- 3. Apply the theory of strong electrolytes; for example, calculate degree of dissociation, activity coefficients, and so on.
- 4. Calculate ionic strength.

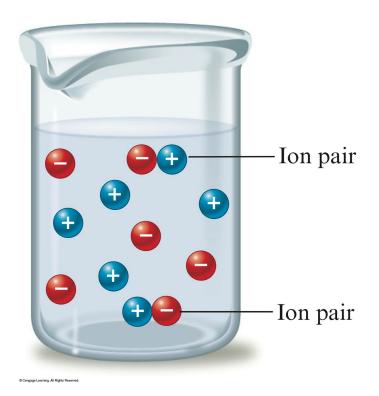

Van't Hoff Factor(i)

- Van't Hoff corrects for the fact that the number of particles you thrown into solution is not always the number of particles that determine the magnitude of the property.
- The relationship between the moles of solute dissolved and the moles of particles in solution is usually expressed as:

Van't Hoff factor (i) = actual number of particles in solution after dissociation number of formula units initially dissolved in solution

Ion Pairing

• At a given instant a small percentage of the sodium and chloride ions are paired and thus count as a single particle.

Examples

- The expected value for *i* can be determined for a salt by noting the number of ions per formula unit (assuming complete dissociation and that ion pairing does not occur).
 - NaCl *i* = 2
 - KNO₃ i = 2
 - Na₃PO₄ i = 4

Ion Pairing

- Ion pairing is most important in concentrated solutions.
- As the solution becomes more dilute, the ions are farther apart and less ion pairing occurs.
- Ion pairing occurs to some extent in all electrolyte solutions.

The van't Hoff Factor of 0.0500 <i>M</i> Electrolyte Solutions at 25°C		
Electrolyte	i (Measured)	i (Calculated)
Sucrose*	1.0	1.0
HCl	1.9	2.0
NaCl	1.9	2.0
MgSO ₄	1.3	2.0
MgCl ₂	2.7	3.0
FeCl ₃	3.4	4.0

Colligative Properties of Electrolyte Solutions

 π = M R T

it was found that the π for electrolytes is approximately 2,3, and more times larger than expected from this equation.

So for electrolyte solution the equation will be

π=i M R T

i= correction factor (Van'ts Hoff factor)

so for the other colligative properties

$$\Delta Tb = i Kb m \qquad \Delta Tf = i Kf m$$
$$\Delta P = i P_1^{\circ} m$$

At what temperature will a 5.4 molal solution of NaCl freeze? Kf= 1.86

$$\Delta T_f = i K_f m$$

 $\Delta T_{f} = 2 \times 1.86 \times 5.4$

 $\Delta T_{f} = 20.1 C^{o}$

 $FP = 0 - 20.1 = -20.1 C^{\circ}$

Degree of dissociation :

To differentiate between the strong and weak electrolytes by the fraction of the moles ionized which is the degree of dissociation \smile

$$\sim = \frac{A_c}{A_0}$$

Ac = equivalent conductance at conc. (c)

Ao = equivalent conductance at infinite dilution.

The correlation between i and \bowtie

$$i = 1 + \mathcal{O}(v-1)$$

i-1

V-1

v : is the no. of ions

Example:

The freezing point of a 0.10 m solution of acetic acid is -0.188 C[°]. Calculate the degree of ionization of acetic acid at this conc. Acetic acid dissociates into two ions. Kf= 1.86 *Ionic strength :*

Relate the interionic attraction for solution of strong electrolytes and for solutions of weak electrolytes together with salts and other electrolytes, such as exist in buffer systems.

 $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_2^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_1^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_2 z_1^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_1 z_1^2 + c_2 z_1^2 + \dots & c_i z_i^2 \end{array} \right)$ $\mu = \frac{1}{2} \left(\begin{array}{ccc} c_1 z_1^2 + c_1 z_1^2$

So µ represents the contribution to the electrostatic forces of the ions of all types. ex. KCI _____ K + Cl 0.01 M 0.01 M 0.01 M 1 $\mu = \frac{1}{2} [(0.01 \times 1^{2}) + (0.01 \times 1^{2})] = 0.01$ $\longrightarrow 2Na + So_4^{-2}$ Na_2So_4 — 0.01 M 2 x 0.01 M 0.01 M $\mu = \frac{1}{2} [(0.02 \times 1) + (0.01 \times 2)]$ = 0.03 μ total = μ KCl + μ Na₂SO₄ (for solution of them)

Example:

- What is the ionic strength of (a) 0.01 M KCl, (b) 0.01M BaSO₄,(c) 0.01 M Na₂SO₄
 - (d) what is the ionic strength of a solution containing all three electrolytes .
- Example:
- A buffer contains 0.3 mole of K₂HPO₄ and 0.1 mole of KH₂PO₄ per liter of solution. Calculate the ionic strength of the solution.

The L value:

 $\Delta Tf = i Kf m$

used for the colligative properties of nonelectrolyte and electrolyte solutions.

in dilute solution it can be modified slightly by

$$\Delta Tf = L c$$

 $c = M molar conc$

At a conc.of a drug that is isotonic with body fluids

L = i Kf = L iso = 1.9 for non electrolytes

= 2.0 for weak electrolytes

= 3.4 for univalent electrolytes
