

# *Gram Positive Bacteria Clostridium*

**Course instructor: Soran Kayfi**

**E-mail: [soran.kayfi@tiu.edu.iq](mailto:soran.kayfi@tiu.edu.iq)**

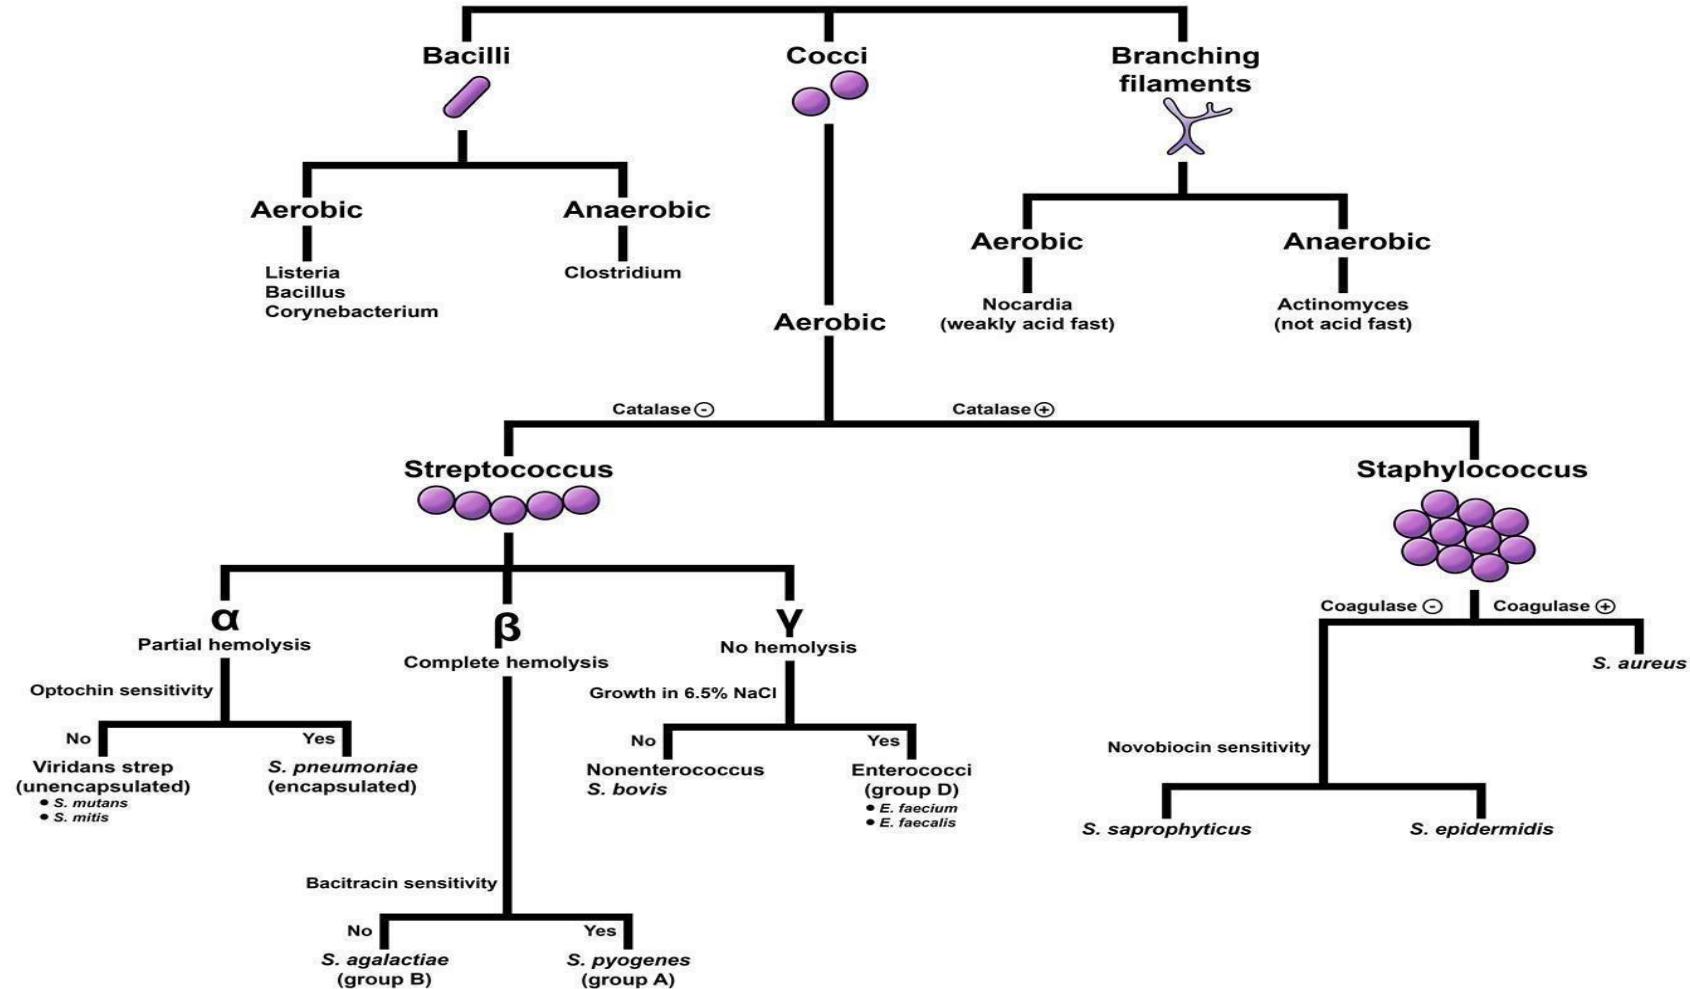

Course: Medical Microbiology (MA 212)

Summer semester

# Outline

- Gram Positive Bacteria
- *Clostridium (general Characteristics)*
- *Endospores*
- *Clostridium Group*

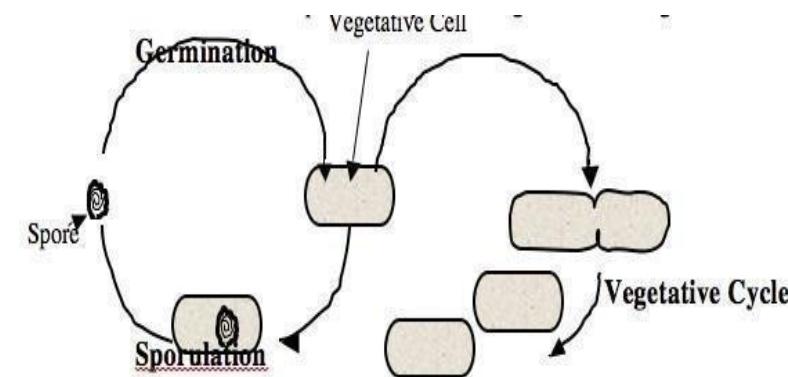

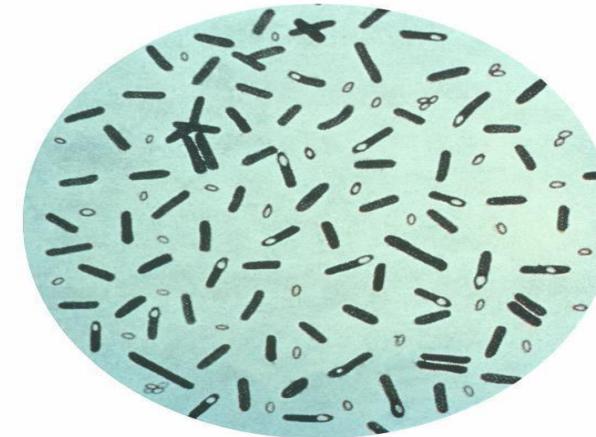

## Gram-Positive Bacteria

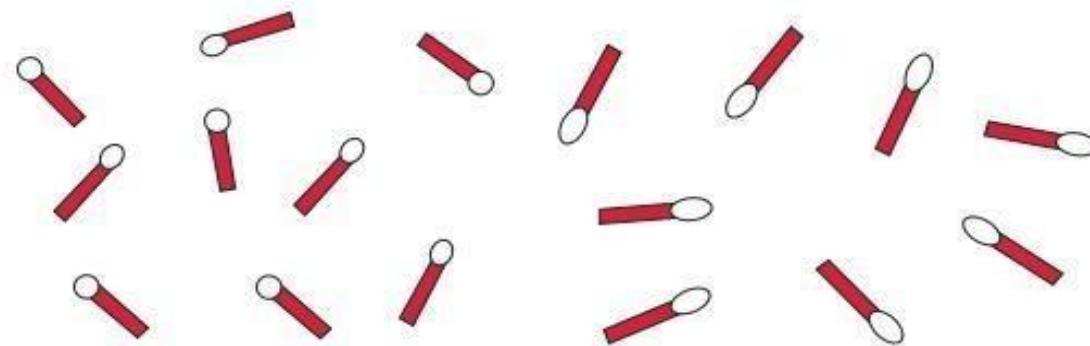

# *Clostridium* :

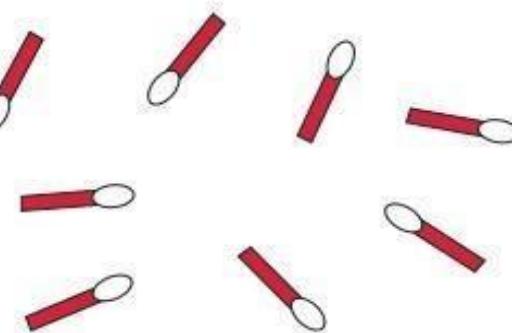

## ➤ General Characteristics

- Gram Positive Bacteria
- Bacilli shape bacteria
- Mostly obligate anaerobic bacteria
- Mostly motile (except *C. perfringens*)
- Mostly are catalase negative
- oxidase negative
- They produce highly resistant **endospore**: which is a highly resistant dormant structure (inactive) formed in response to adverse environment

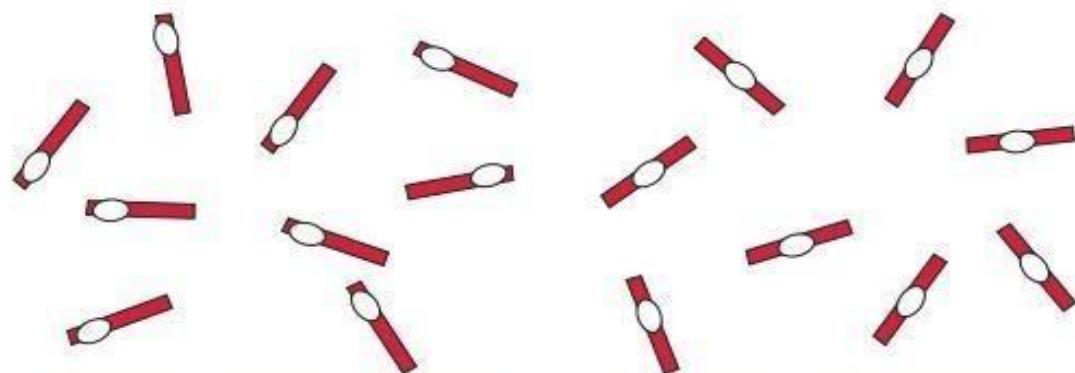

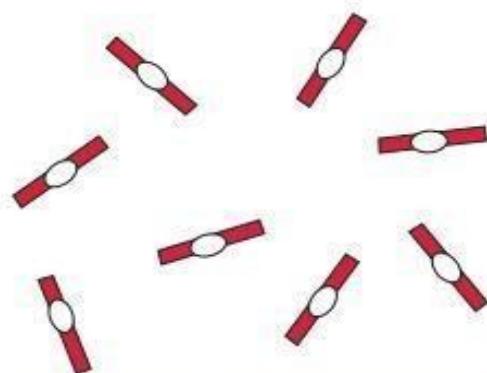

spherical and terminal spores  
(e.g., *Clostridium tetani*)

oval and terminal spores  
(e.g., *Clostridium tertium*)

oval and sub-terminal spores  
(e.g., *Clostridium perfringens*)

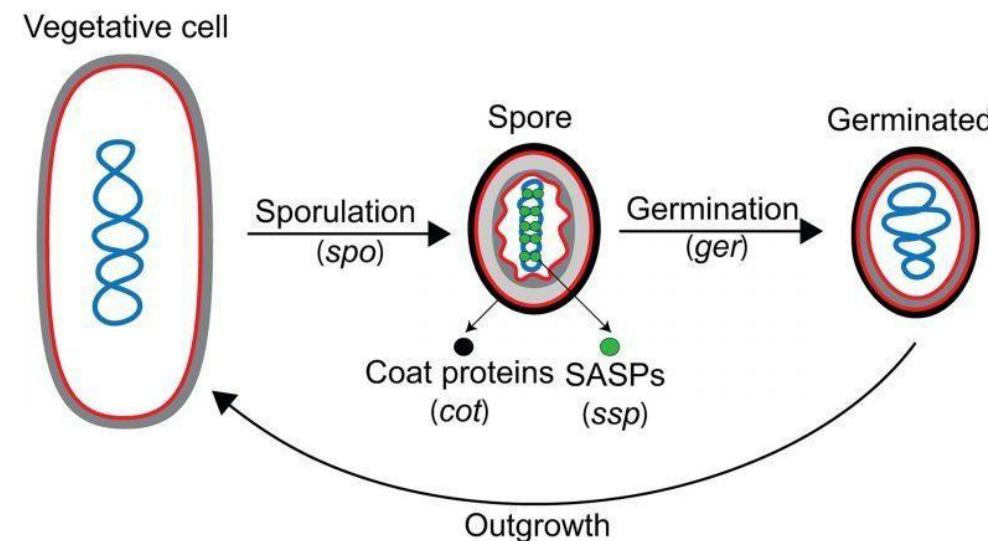

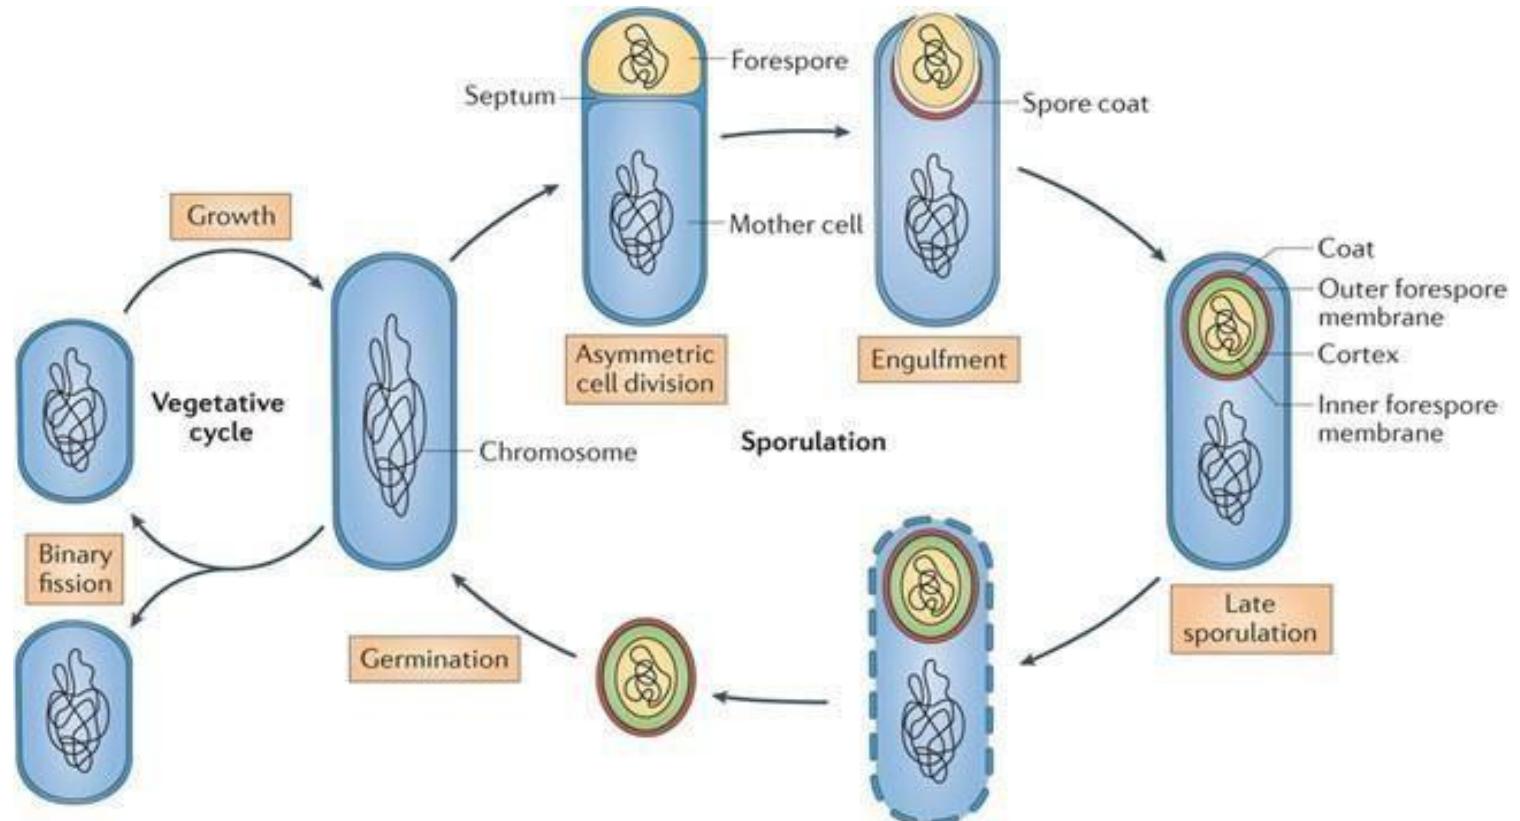

oval and central spores  
(e.g., *Clostridium bifertmentans*)

## Types of spore position in *Clostridium*

## What is the difference between vegetative cell and Endospores ?

- **Endospores** are only formed by a few **gram-positive** bacteria and provide the cell with **resistance** to a wide variety of harsh conditions, such as **starvation, extremes in temperature, exposure to drying, UV light, chemicals, enzymes, and radiation**.
- While the **vegetative cell** is the **active** form for bacterial cells (growing, metabolizing, etc), the endospore can be thought of as a **dormant (inactive)** form of the cell. It allows for survival of adverse conditions, but it does not allow the cell to grow or reproduce.

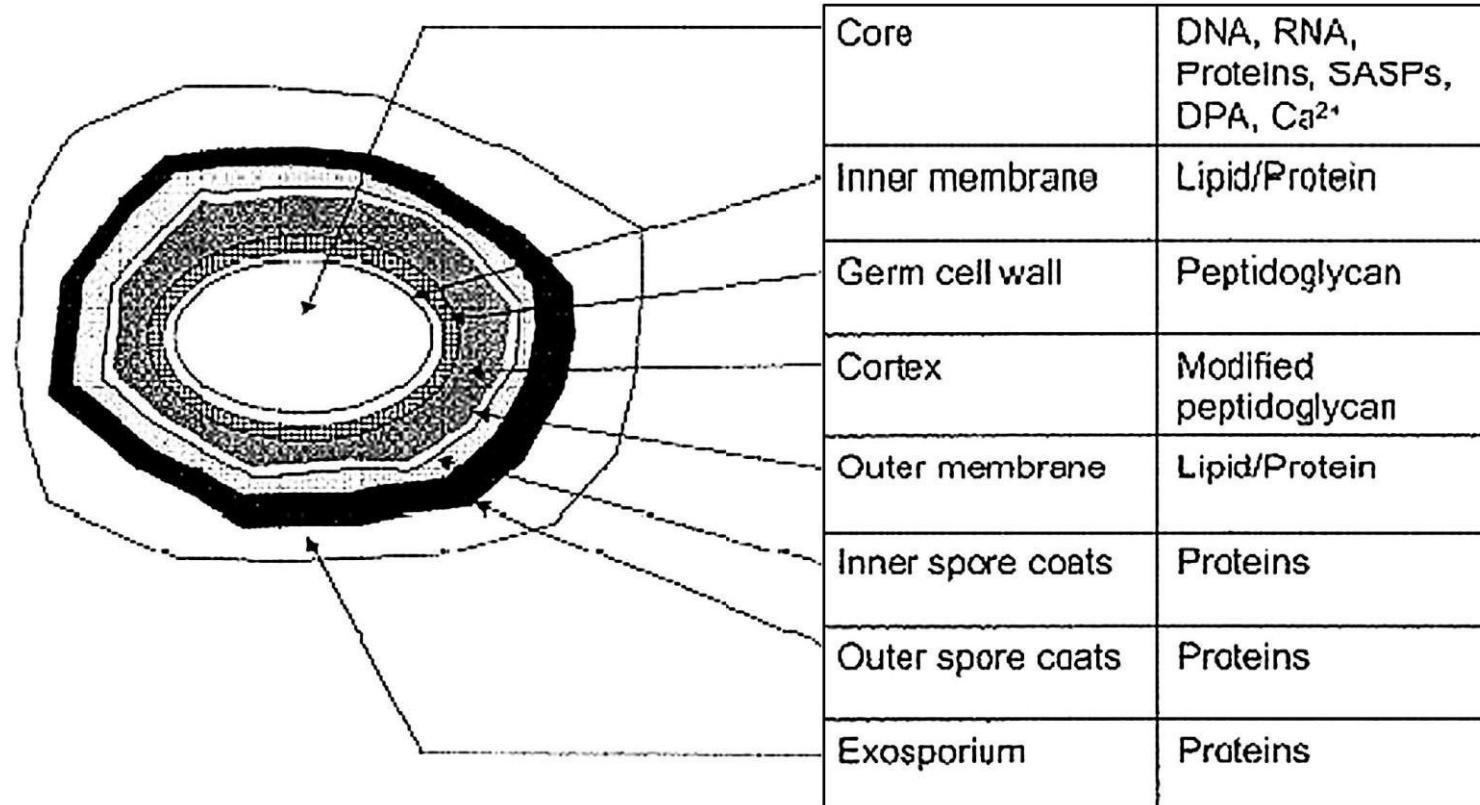

**Vegetative cycle**

**Endospore formation Steps  
Sporulation**

# Structure of spore

# Most important pathogenic species of *Clostridium*

## 1- Neurotoxic Group

## 2- Histotoxic group

## 3- Enterotoxigenic

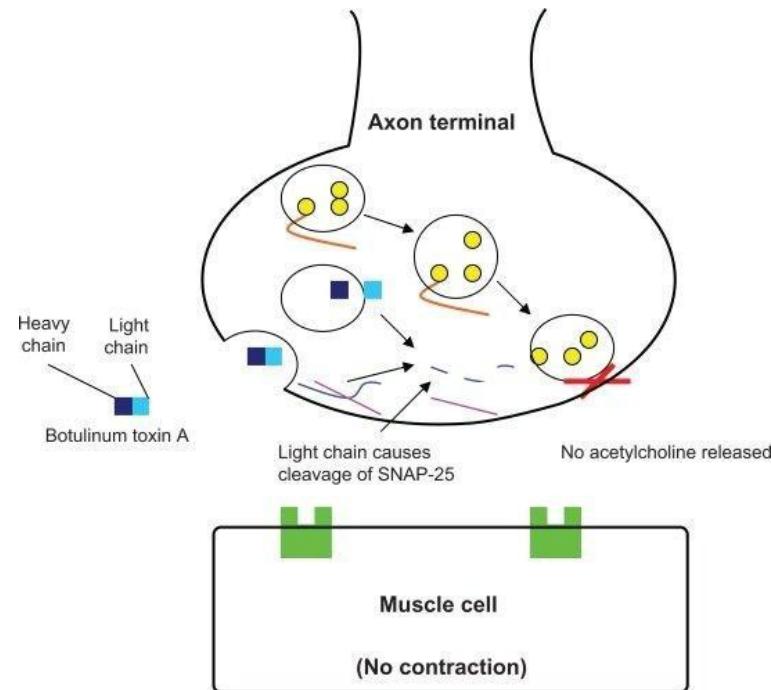

**1- Neurotoxic Group (affect nervous system)** interfere with normal **nerve function**)

Examples: (A- ***Clostridium botulinum*** , B- ***Clostridium tetani***)

- A- ***Clostridium botulinum*** can produce **botulinum toxin** in food or wounds and can cause **botulism infection**.
  - This same toxin is known as Botox and is used in cosmetic surgery to paralyze facial muscles to reduce the signs of aging; it also has numerous other therapeutic uses.
  - **Botulism** is a rare but severe illness caused by a toxin that affects the nervous system. It can lead to breathing problems, muscle paralysis, and, in some cases, death.

## Types of botulism

- Foodborne (intoxication, 1-2 days incubation period)
- Infant (ingestion of spores in honey)
- Wound (symptoms similar to foodborne, but 4 or more days incubation)

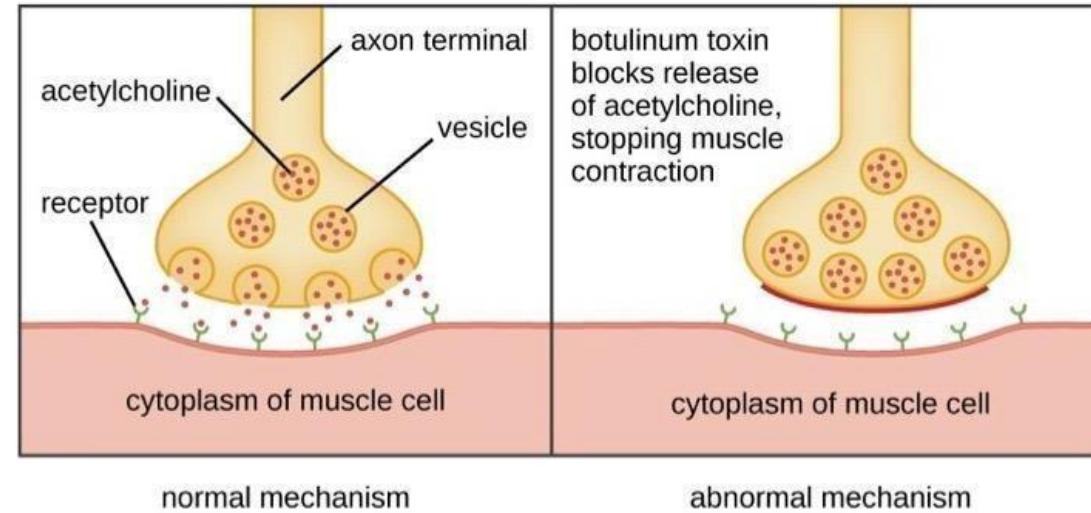

**B- *Clostridium tetani* causes tetanus infection .**

- **Tetanus** is a severe nervous system condition caused by a bacterium that produces toxins. It leads to **muscle spasms**, especially in the jaw and neck areas.
- What is the difference between Botulism and Tetanus?

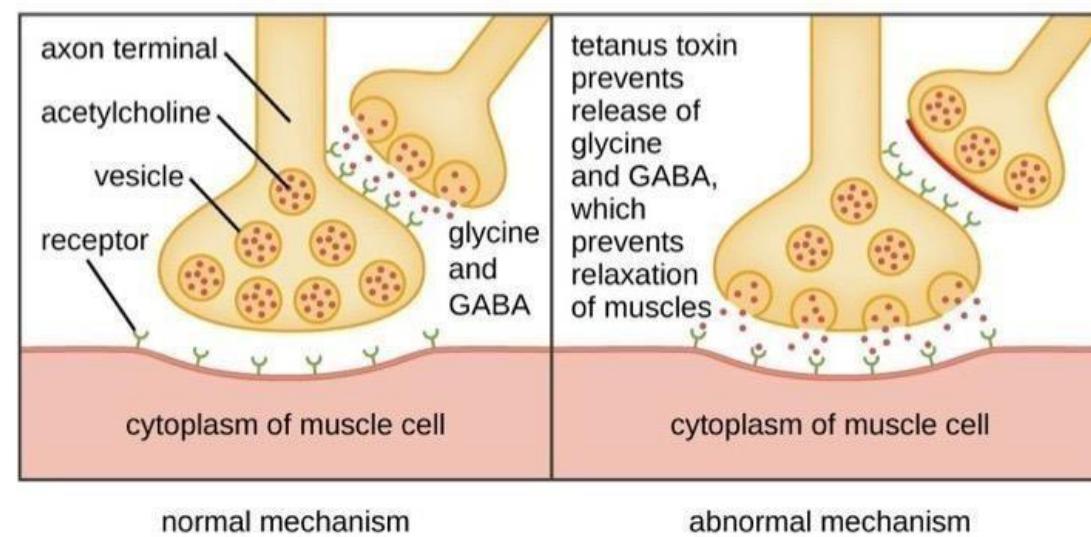

**Tetanus infection**

## Mechanism of Botulinum Toxin

## Mechanism Tetanus Toxin

## Mechanism of Neurotoxin (Tetanus and Botulism Toxin)

## 2- Histotoxic group

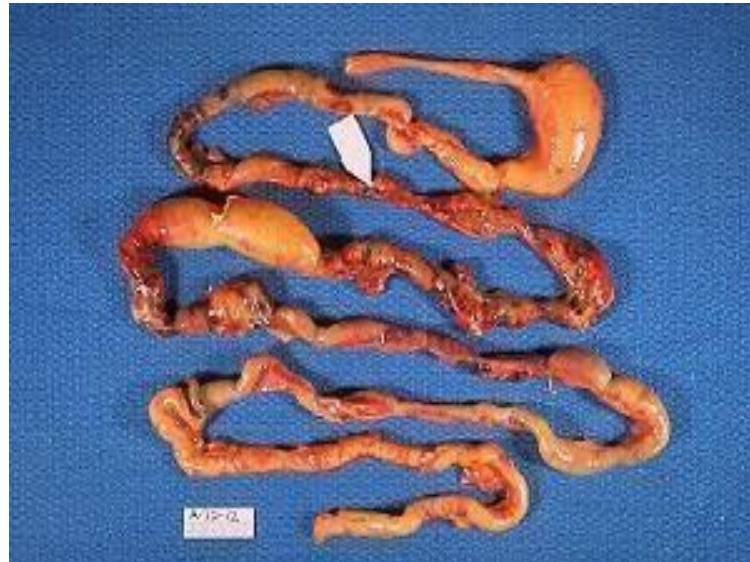

(The "histotoxic group" refers to a type of toxin that harms the body's tissues)

**Example:** *Clostridium perfringens* causes a wide range of symptoms, from **food poisoning** to **cellulitis**, and **gas gangrene**.

## 3- Enterotoxigenic group

**Example:** *Clostridium difficile*: causes **diarrhea** and **colitis** (an inflammation of the colon)

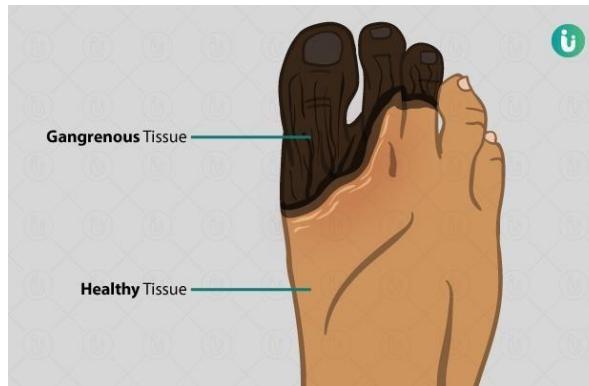

- a. Clostridial foodborne disease (8-24h after ingestion of large numbers of organisms on con-taminated meat products, spores germinate, enterotoxin produced (*C. perfringens* type A))
- b. Necrotizing enteritis (beta toxin-producing *C. perfringens* type C)

Necrotizing enteritis *Clostridium difficile*

Pseudo membrane colitis *Clostridium difficile*

Gas Gangrene (*Clostridium perfringens*)
