Web Programming

Outlines

- **Introduction to PHP**
- **Laragon Setup**
- **Visual Studio Code Setup**
- **PHP Basic Syntax**
- **Case Sensitivity**
- **Comments**

Learning Outcomes

■ At the end of today's session, you will be able to:

- ✓ Define PHP and describe its role in web development.
- ✓ Implement a local PHP environment using Laragon and VS Code.
- ✓ Explain PHP basic syntax, including case sensitivity and comments.
- ✓ Develop simple PHP scripts using echo or print.

What is PHP?

- PHP (recursive acronym for PHP: Hypertext Preprocessor) is a widely-used open source general-purpose scripting language that is especially suited for **web development** and can be embedded into HTML.

Introduction to PHP

Introduction to PHP

Why PHP?

- It's easy to learn and use
- It's open source (and therefore free!)
- It's versatile
- It enjoys community support
- It's fast and secure
- It is well connected with databases
- It is tried and tested

Introduction to PHP

- What tools do we need?

✓ **Laragon:** is a free and open-source local web server. Wamp server

,MAMP, LAMP and Xampp are okay.

✓ **Visual Studio Code (VSCode):** is a free source-code editor made by

Microsoft for Windows, Linux and macOS. Features include support for debugging, syntax highlighting, intelligent code completion, snippets, code refactoring, and embedded Git.

Atom, Sublime, Notepad++ and PHPStorm are okay.

Laragon Setup

1. Open Google Classroom and find Laragon in Tools section.

Laragon

Compressed archive

[View material](#)

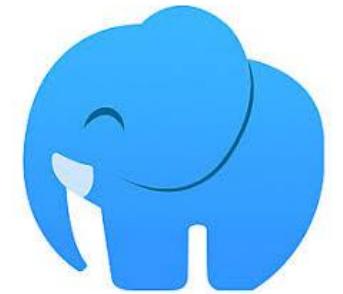

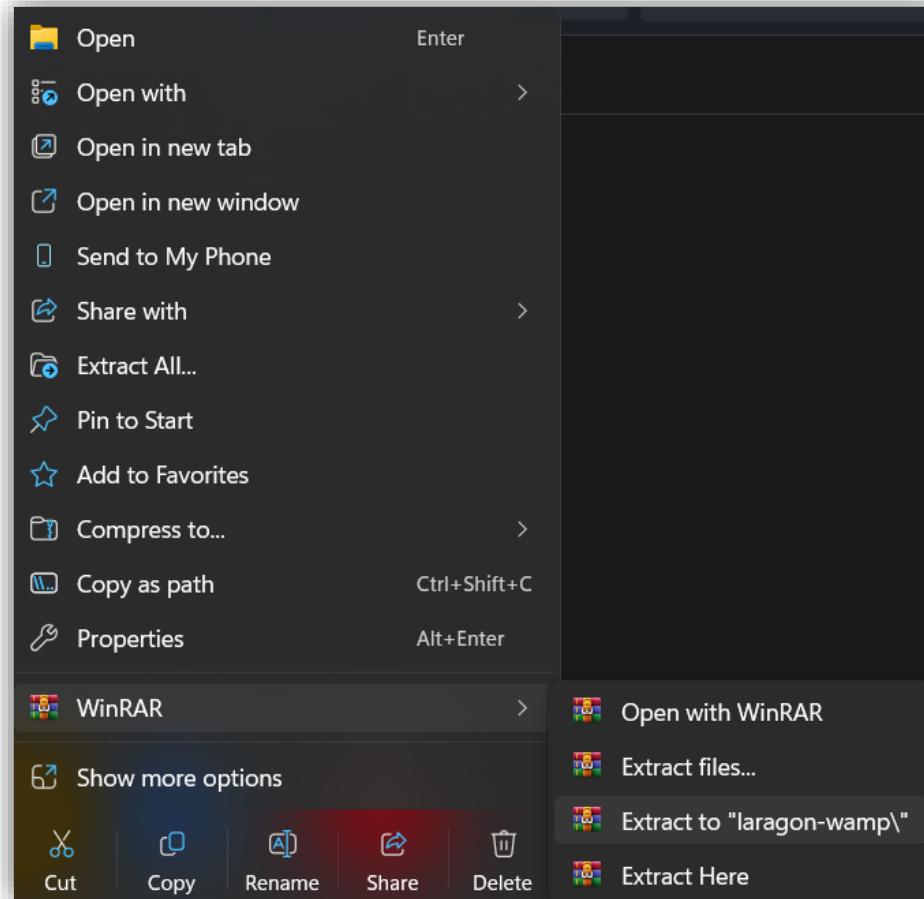

Laragon Setup

2. Download the Laragon.

Laragon Setup

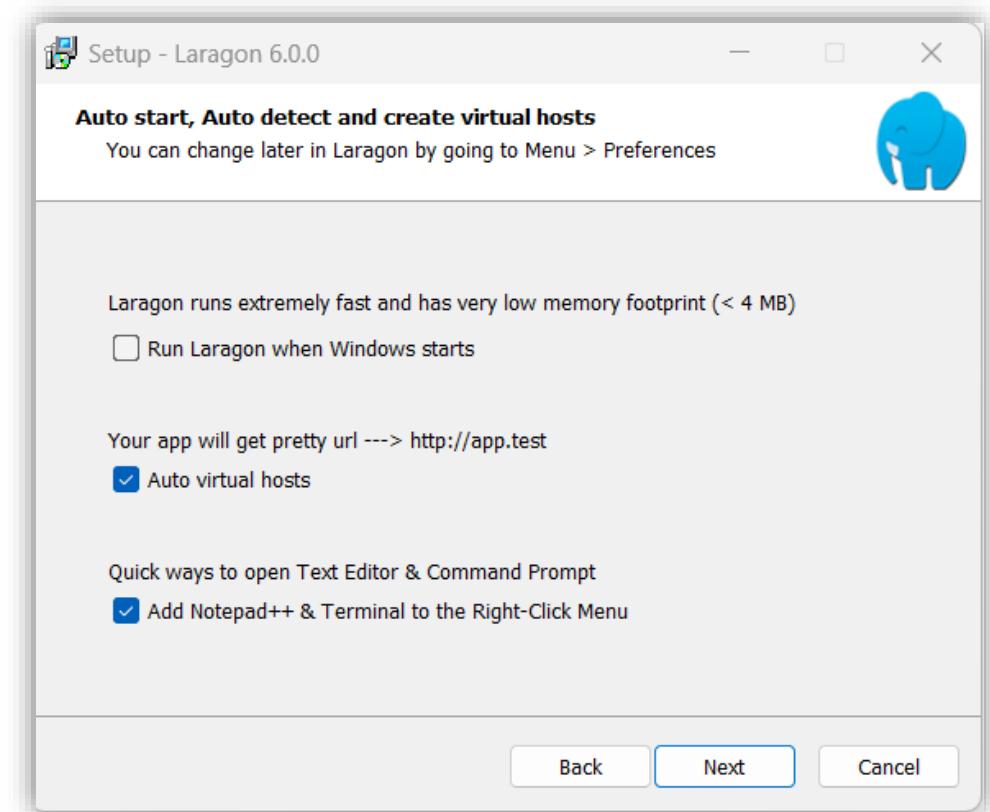

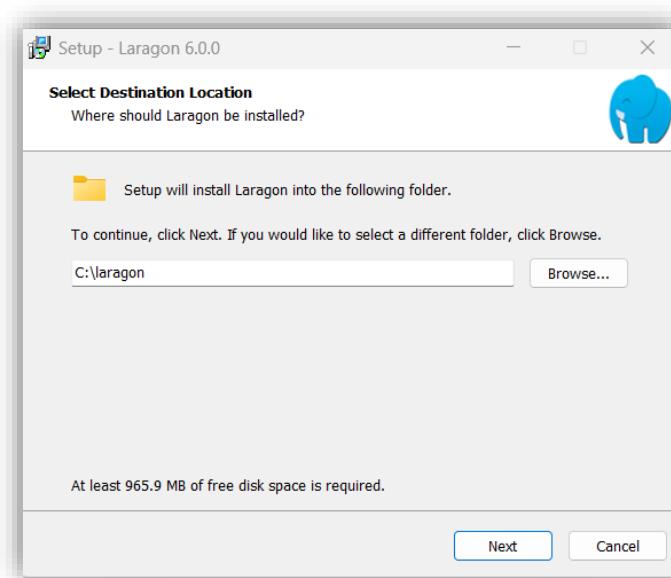

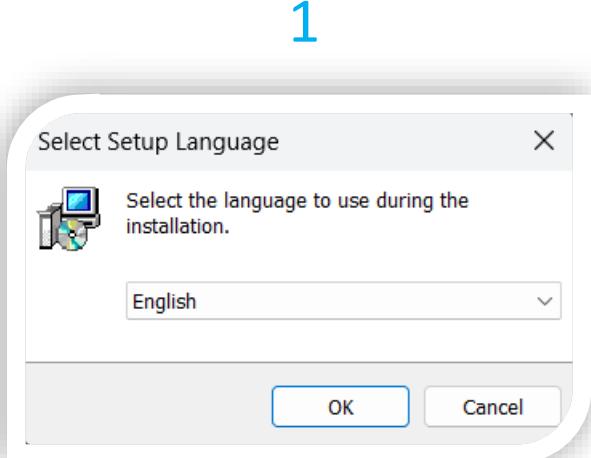

3. Click on the Laragon folder and Extract to “laragon-wamp\”.

Laragon Setup

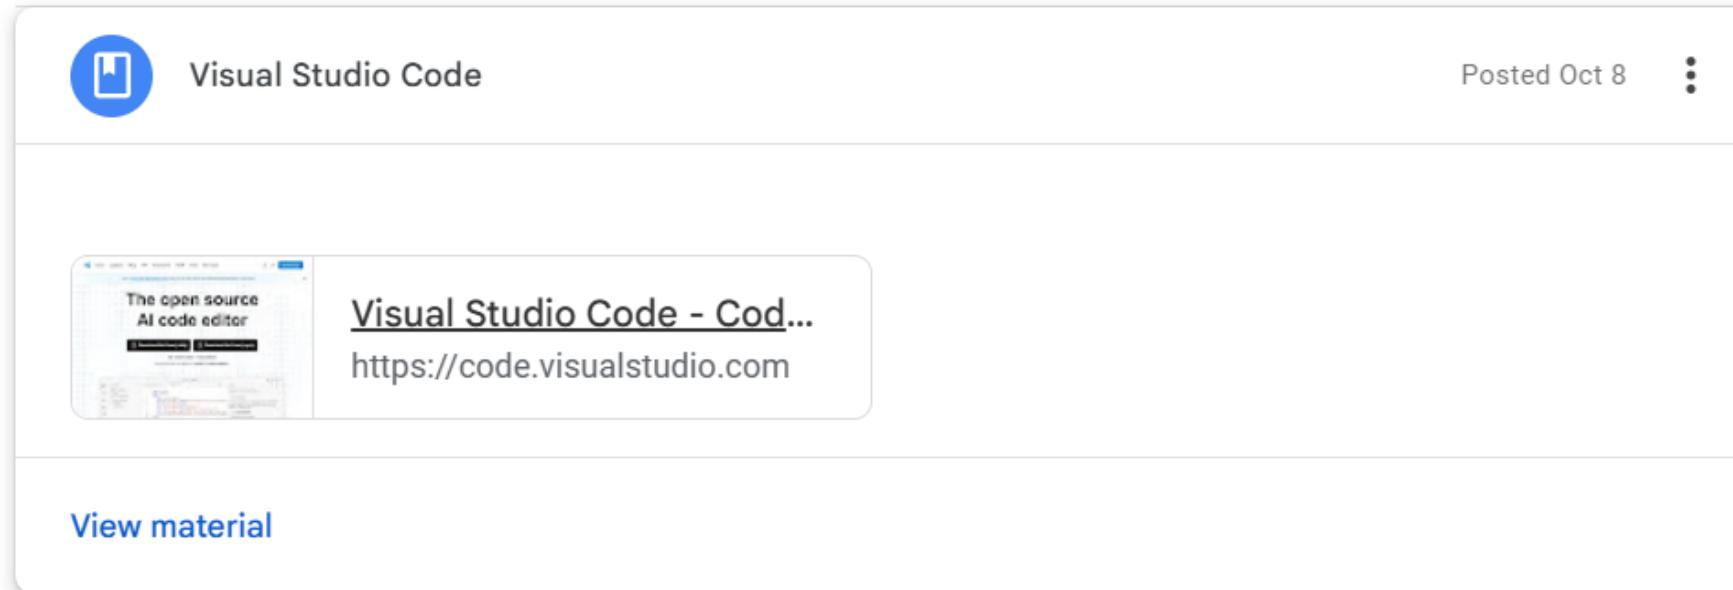

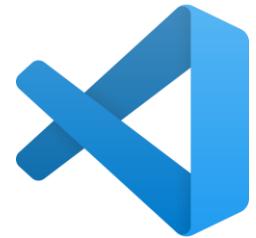

4. Installing Steps

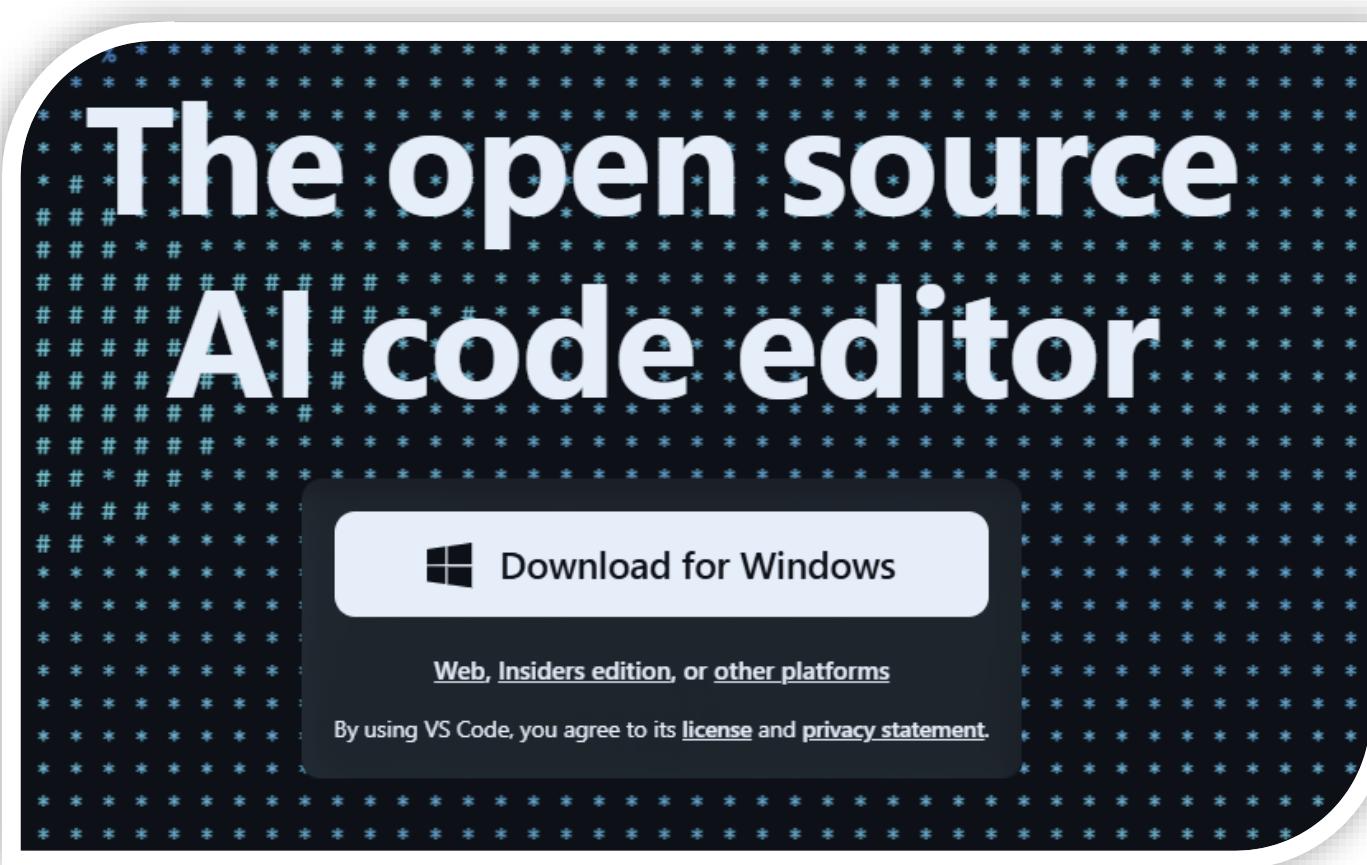

Visual Studio Code Setup

1. Open Google Classroom and find Visual Studio Code in Tools section.

A screenshot of a Google Classroom post. The post is titled "Visual Studio Code" and was "Posted Oct 8". It contains a link to "Visual Studio Code - Cod..." with the URL "https://code.visualstudio.com". There is a "View material" button at the bottom left.

Visual Studio Code Setup

2. Download the Visual Studio Code.

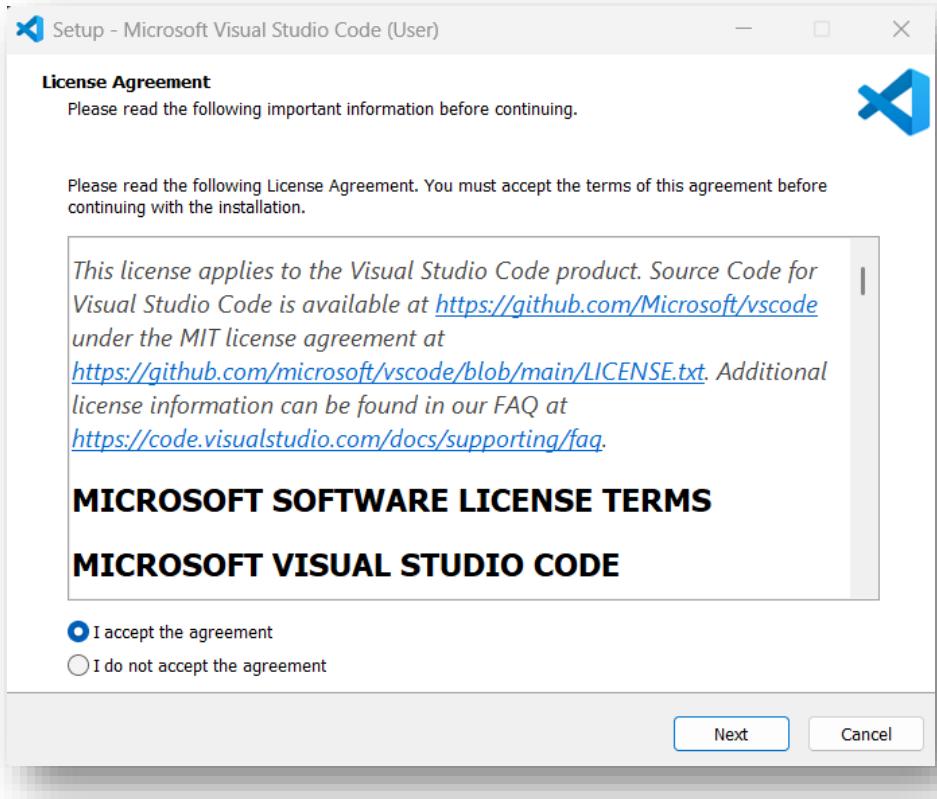

Visual Studio Code Setup

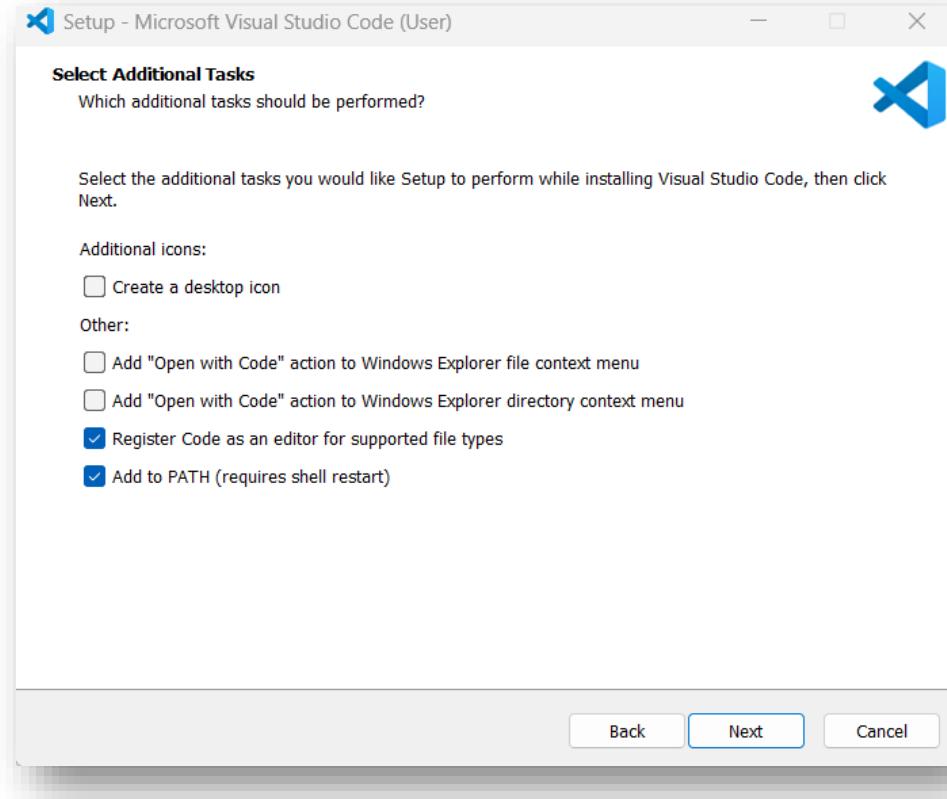

3. Steps to install the Visual Studio Code.

1

2

- The following content could go into a file named `firstCode.php`
- A block or file of PHP code begins with `<?php` and ends with `?>`

```
<?php  
?  
?>
```

```
<?php  
echo "Hello PHP"  
print "Hello PHP"  
?>
```

- PHP statements, function declarations, etc. appear between these endpoints.
- You can use “`print`” or “`echo`” for printing in PHP.

PHP Basic Syntax

- Example

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  <?php
    echo "Hello PHP!";
  ?>
</body>
</html>
```

PHP Basic Syntax

```
<?php
echo "Hello, World!";
echo "I am studying at \"TIU\" university/";

echo "You may have
line breaks but it will not be a new line.';

echo 'We can use "single-quotes" and it\'s cool!';
?>
```

Hello, World! I am studying at "TIU" university! You may have line breaks but it will not be a new line. We can use "single-quotes" and it's cool!

Case Sensitivity

- The names of user-defined classes and functions, as well as built-in constructs and keywords are **case-insensitive**.

```
<?php
    Echo "Hello, World!";
    ECHO "Hello, World!";
    echo "Hello, World!";
?>
```

```
<?php
    print("hello, world");
    Print("hello, world");
    PRINT("hello, world");
?>
```

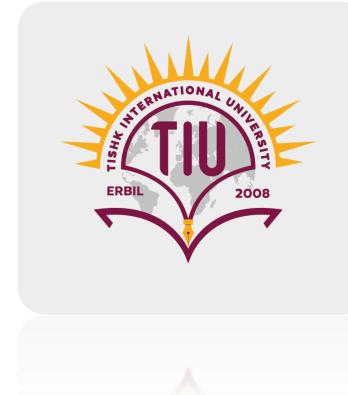

✓ All three lines are equivalent.

Comments

```
<?php
# single-line comment
echo " Hello!";
// single-line comment

/*
multi-line comment
*/
?>
```

Lab Assessments and Next Lecture's Topic

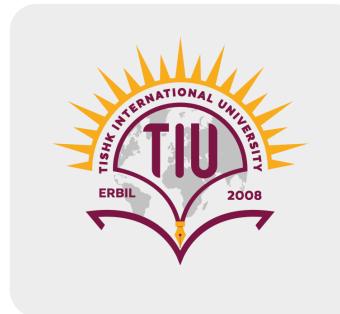

Lab Assessments

- **Solving Practical Questions**

Next Lecture's Topic

- **Variables and Pre-defined Functions**
