

**Q1.** Design a web application that includes a form for updating student information. The user should enter a student **ID** along with the new **name**, **grade**, and **email**, and the system should update the corresponding record in the **students** table and display a success message after the update in another page.

**form.php**

## Update Student Information

Student ID

Name

Grade

Email

**secondPage.php**

localhost/test/secondPage.php

The data has been successfully updated.

**Q2.** Write a PHP script with a form that deletes a student record from the **students** table using the student's email and displays a success or error message on another page.

**delete.php**

## Delete Course Registration

Student Email:

**secondPage.php**

localhost/test/secondPage.php

Record deleted successfully.
